16. Abstract This submission updates Volume III to the latest Acquisition Phase specification for ISSS, and includes corrections and improvements as necessary. This volume is one of a series of operations concepts for the FAA's Advanced Automation System (AAS). It describes how en route controllers in Air Route Traffic Control Center facilities may perform their operational jobs in the Initial Sector Suite System (ISSS) environment. ISSS functionality is assumed to be as described in the AAS System Level Specification, 28 August 1987. Included here are: Composition Graphs, showing the logical flow of operational tasks performed in response to or anticipation of external Air Traffic Events; a series of analyses of these tasks, including Task Information Requirements, Cognitive/Sensory Attributes, and Performance Criteria; a User Interface Language aggregating system input and output messages in a hierarchical organization; decomposition of tasks to their constituent procedural elements; traceability between tasks and supporting ISSS functionality; and sample operational scenarios for each position. Data presented here are generated and maintained using the Computer-Human Operational Requirements Analysis System (CHORAS). CHORAS includes an automated task data base, specialized graphing capabilities, and display and hard copy output features tailored to the needs of operations concept analysis. <i>Keller, 1988</i>

FOREWORD

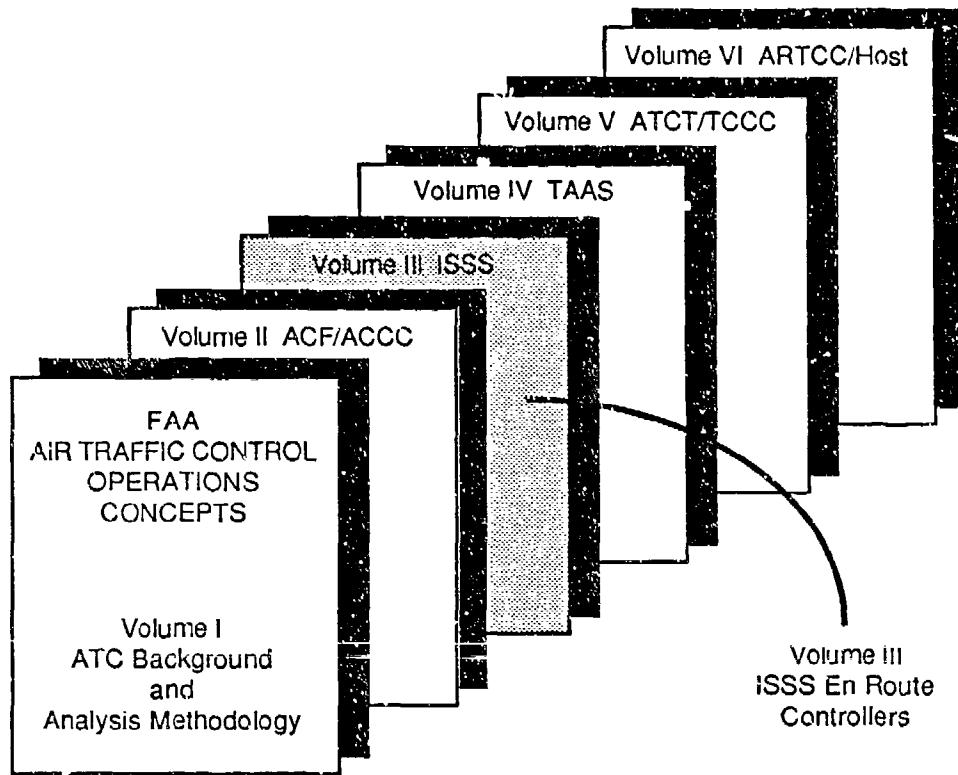

This document constitutes Volume III of a series of volumes which collectively define Air Traffic Control (ATC) Operations Concepts for the Federal Aviation Administration (FAA). This series was developed specifically to support the Advanced Automation System (AAS) and considers operations in today's facilities and the automated capabilities planned for the AAS in order to reach an understanding of how controller and other operational jobs will be performed as AAS evolves.

The AAS will provide enhanced capabilities to support operational ATC personnel in the en route, terminal, and tower environments; include automated capabilities to process and display surveillance data (targets, tracks, and weather), flight data, and environmental and status data, to assist the controller in maintaining a safe, orderly, and expeditious flow of traffic; provide supervisory and maintenance data and controls; and include message entry, information processing, and display outputs adaptable to the requirements and individual preferences of each controller. Ultimately, the AAS advanced automation features are expected to improve productivity by providing controllers with various strategic planning capabilities, while relieving controllers of certain routine control actions.

Evolution from the current system to the full AAS environment will progress through several major stages. This multi-volume series provides ATC personnel the Operations Concepts for selected operational positions in these different stages of AAS evolution. Volumes currently consist of the following:

- Volume I, ATC Background and Analysis Methodology - includes material common to all Operations Concept analyses in subsequent volumes, and defines analysis concepts used in those volumes.
- Volume II, ACF/ACCC Terminal & En Route Controllers - addresses the domestic en route and terminal controller in the full AAS with Automated En Route Air Traffic Control (AERA) I capabilities.
- Volume III, ISSS En Route Controllers - addresses the domestic en route controller in the Initial Sector Suite System (ISSS) environment.
- Volume IV, TAAS Terminal Controllers - addresses the terminal controller in the Terminal Advanced Automation System (TAAS) environment.
- Volume V, ATCT/TCCC Tower Controllers - addresses the tower controller in the Tower Control Computer Complex (TCCC) environment.
- Volume VI, ARTCC/Host En Route Controllers - addresses today's domestic en route controller in the Air Route Traffic Control Center (ARTCC)/Host environment.

Future volumes addressing other AAS phases and/or operational positions will be published as required. The volumes currently identified are represented in the illustration (page vi).

FAA Air Traffic Control Operations Concepts Volumes

Volume I provides a brief overview of the current ATC environment and planned enhancements, as well as descriptions of the analysis methodology used to produce the operations concepts of subsequent data volumes. Volume III focuses on en route (non-oceanic) controller operations in the Air Route Traffic Control Center (ARTCC) of the full Initial Sector Suite System (ISSS). It considers operations in today's facilities and the ISSS and Sector Suite capabilities planned for AAS, in order to reach an understanding of how controller jobs will be performed within the ISSS.

Each of the other data volumes focuses on one or more operational positions in a particular type of ATC facility at a specified stage of AAS development. Each of these data volumes is an operations concept describing how controllers will perform their operational duties, given the support of the automated capabilities provided at the specified stage of AAS development.

Configuration control procedures have been developed to ensure that operational requirements data are maintained for currency, completeness, and consistency with the AAS System Level Specification (SLS). This will be accomplished via change pages whenever possible rather than republishing a new or updated volume. Substantive changes to the original volume are indicated

by a black line as shown in the margin of this paragraph. The "List of Effective Pages" (page iv) provides the current status of each page in this volume and will be updated with each subsequent change. Changes will reflect new design information and derived requirements resulting from design maturity, changes in specification requirements, and the impact of other AAS programs such as the Voice Switching and Control System (VSCS).

The value of these results rests heavily upon contributions of those active in and familiar with the present system and knowledgeable in the planned ACCC system of the future. The authors wish to express their thanks to the following members of the Sector Suite Requirements Validation Team (SSRVT) who, in addition to providing much valuable time and insight into operational matters, also provided detailed review and validation of the contents of this volume:

SECTION 1
INTRODUCTION**1.1 PURPOSE**

This volume portrays the operational actions of ARTCC en route controllers in the ISSS environment from the controller's viewpoint. It includes an introduction (Section 1), brief supplementary information to Volume I pertaining to the analysis methodology used for the ARTCC/ISSS en route position (Section 2), and a series of appendices presenting the data developed through the present analysis.

1.2 ANALYSIS METHODOLOGY

Section 2 of this volume discusses special features of the analysis methodology that are applicable to the Operations Concept for ARTCC/ISSS en route controllers. A detailed discussion of the analysis methodology is found in Volume I, Section 3.

The focus of the methodology is on the interaction between the controller and the automated system; however, controller tasks involving no interaction with the system are included where appropriate. The analysis excludes non-operational tasks such as administrative tasks and tasks related to training. Non-FAA controllers and ATC oceanic controllers are not addressed.

Each ATC facility exhibits unique features. The amount and composition of the workload varies significantly from one facility to the next, and varies within a particular facility over time. Tasks that are performed frequently in one facility may be rare in another. Therefore, this analysis addresses a "generic" Air Route Traffic Control Center, where the analysis is broad enough to capture all significant controller tasks performed in the Initial Sector Suite System. Tasks performed very infrequently by a typical controller are omitted, unless they are of overriding criticality when they occur.

En route team controllers (R, D, and A) are analyzed together because they work as a sector unit. Similarly, the Handoff Controller position is integrated into the position for this analysis.

1.3 APPENDICES

Data developed through the present analysis are contained in the following series of appendices to this volume and parallel the methodology discussion of Volume I, Section 3:

- Appendix A: Composition Graphs
- Appendix B: Task Statements and Event to Sub-Activity Trace
- Appendix C: User Interface Language

- Appendix D: Task Characterization Analyses
 - Task Information Requirements
 - Cognitive/Sensory Attributes
 - Performance Requirements
 - *Deleted*
- Appendix E: Task Element Statements
- Appendix F: Traceability Tables
- Appendix G: Site Visit Information
- Appendix H: Expanded Operational Scenarios

1.4 ASSUMPTIONS

The assumptions for this analysis are as described in Volume I, Section 1.5. No new assumptions are identified.

1.5 DOCUMENT INTERFACE

The Operations Concept Analysis contained in this volume was developed from the methodology defined in Volume I. Thus, Volume I is necessary for full understanding of the analysis methods used to develop the data in this volume, and the following Volume I appendices should be referred to for topical material relevant to the present analysis:

- Appendix A: Air Traffic Events
- Appendix B: Baseline Operational Scenarios
- Appendix C: Verb Glossary (Task, Element)
- Appendix D: Glossary of Terms
- Appendix F: ATC Task Element Modules
- Appendix G: References
- Appendix H: Acronyms

Reference citations in this volume are to references reported in Volume I, Appendix G. Reference numbers are given between brackets [].

SECTION 2
METHODOLOGY

2.1 GENERAL PROCESS

The analysis of the ARTCC/ISSS en route position essentially followed the order in which the methodology is described in Volume I, Section 3. It is based upon and derived from the ACF?ACCC en route and terminal controller Operations Concept reported in Volume II of this series. The present analysis is to the AAS System Level Specification (Draft), Acquisition Phase [21] dated 28 August 1987.

New and revised tasks appropriate to the ISSS were identified in the System Level Specification and added to the ACF/ACCC Composition Graphs of Volume II. These are inserted in appropriate locations on the position's sub-activity Composition Graphs of Appendix A. ACCC tasks not included in ISSS and AERA 1 tasks are deleted, as are tasks or portions of tasks focusing purely upon terminal control operations. All graphs were subjected to thorough review for completeness and logic, with some new tasks identified as being warranted. The resultant tasks, along with a listing of non-task ISSS ancillary actions and a trace of each sub-activity to specific ATC events, are presented in Appendix B.

Controller input messages and display output messages are updated to the System Level Specification [21]. These results are incorporated in the User Interface Language (UIL) of Appendix C.

Characterizations of each ISSS task are accomplished in terms of task type, information requirements, frequency and criticality ratings, cognitive/sensory attributes, performance criteria, and interaction techniques. These are reported in the three task characterizations of Appendix D. Information requirements are updated to the current User Interface Language of Appendix C.

Each task is decomposed to its constituent procedural steps and actions. These actions, called "elements," represent the lowest level description of controller-machine interaction with respect to system-level requirements. The ISSS Task Element tables are contained in Appendix E.

Traceability is maintained between operational ISSS tasks and specific system requirements documented in the AAS System Level Specification [21]. The results of this trace, along with a report of "orphan" tasks not traced to the system requirements, are contained in Appendix F.

The baseline en route operational scenarios reported in Volume I, Appendix B, are expanded to reflect the operational tasks involved in each. Thus, they present operational solutions to the problems posed in the baseline scenarios. These are recorded in Appendix H.

The ISSS sub-activity Composition Graphs, task data, characterizations, elements, and operational scenarios, were subjected to review and validation by system users, as represented by the Sector Suite Requirements Validation Team.

2.2 SPECIAL METHODOLOGY FEATURES

For this generation of the Operations Concept there were no new site visits. Previous site visits and controller interviews were accomplished in producing the original Operations Concepts for terminal and en route controllers [2, 6]. The procedural emphasis for the present volume was on information reported in the System Level Specification [21] and reviews of task and data revisions by system users. Appendix G, therefore, reports no new site information.

All task information, characterizations, elements, and requirements traces are contained in a new automated data base for more efficient updating in the future. This data base is managed by a tool called the Computer-Human Operational Requirements Analysis System (CHORAS) [16]. This system enhances the consistency and completeness of the Operations Concept data when changes and updates are necessary.

Additionally, CHORAS permits the rapid generation of Operational Concepts for the various AAS segments as reported in Volume III (for the Initial Sector Suite System terminal controllers), Volume IV (for the Terminal Advanced Automation System En Route controllers), Volume V (for the Terminal Advanced Automation System terminal controllers), and Volume VI (for today's Air Route Traffic Control Center/Host en route controller). Volume II (for the ACF/ACCC en route and terminal controllers) serves as the baseline for the production of these other four Operations Concepts.

The scope of a task may change from one transition state to another because changes in system functionality change how the controller performs the task, or alter what data are required to perform the task. Where this occurs, separate task numbers (from those baseline task numbers reported for ACF/ACCC tasks in Volume II) are employed even though the task statement itself may remain applicable to ISSS. For ISSS these separate numbers for altered tasks, as well as for any new tasks not included in the ACF/ACCC Operations Concept of Volume II, begin with the number 50. Otherwise, the task numbers are identical to those recorded in Volume II, to provide task traceability from one transition state to another. Task changes too small to be significantly evident at the Task Element level (Appendix E) are not renumbered.

In the ISSS environment there are some non-AAS controller input and display output messages carried over from current operations. These are not listed in the User Interface Language of Appendix C. Nor are they cited as objects in the Task Element tables of Appendix E. These non-AAS objects are noted in the element statements using initial capital letters, but are not emphasized by underlines between words.

APPENDIX A

COMPOSITION GRAPHS

This appendix contains the Composition Graphs for each of the 47 sub-activities of the ARTCC/ISSS en route controllers. These are grouped by six higher-level activities for the position:

- A1.1 Perform Situation Monitoring
- A1.2 Resolve Aircraft Conflicts
- A1.3 Manage Air Traffic Sequences
- A1.4 Route or Plan Flights
- A1.5 Assess Weather Impact
- A1.6 Manage Sector/Position Resources

Each level of decomposition is represented graphically. The top-level graph of the position, showing all six activities, immediately follows the Composition Graph Symbology figure. Activity Composition Graphs precede the set of sub-activity graphs making up that activity. There are 371 distinct tasks incorporated within the 47 sub-activity Composition Graphs.

Sub-activities are linked (in most instances) to one or more ATC events which influence the accomplishment of the sub-activity. This linkage is identified in Appendix B.

The use of symbology in the Composition Graphs is portrayed in Figure A-1. In addition to logical flow and path conditionals, the sub-activity Composition Graphs show the coordination which forms a large part of the controller's job. For each task involving coordination and communication with others, the top row of the task statement boxes is annotated with the coordination points that may apply. These may be other positions or other agencies or facilities. The task box also depicts, at the bottom row, the media by which that coordination may be accomplished. Figure A-1 also identifies the abbreviations employed for each coordination point and for each communication medium. The use of the Voice Communications (V) medium implies any voice means, either by Voice Switching and Control System (VS&CS) or use of direct person-to-person talking when the recipient is within hearing distance. Because a task may appear as part of more than one sub-activity, the coordination data encompass all cases; not all coordination points or media may apply in a particular sub-activity occurrence of a task, nor in all situations in which that sub-activity is performed on the job.

In some cases, a particular set of tasks may be relevant to many sub-activities. To save space and graphing complexity, these sets are designated as "macros" and a special graph symbol of an oval is used to depict that entire set of tasks. This shorthand feature is used for two such macros in this analysis. These are the macros of:

A1.0.0.0, Generate Clearance Macro (comprised of selected tasks from Sub-Activity A1.4.1, Planning Clearances, and Sub-Activity A1.4.10, Issuing Clearances);

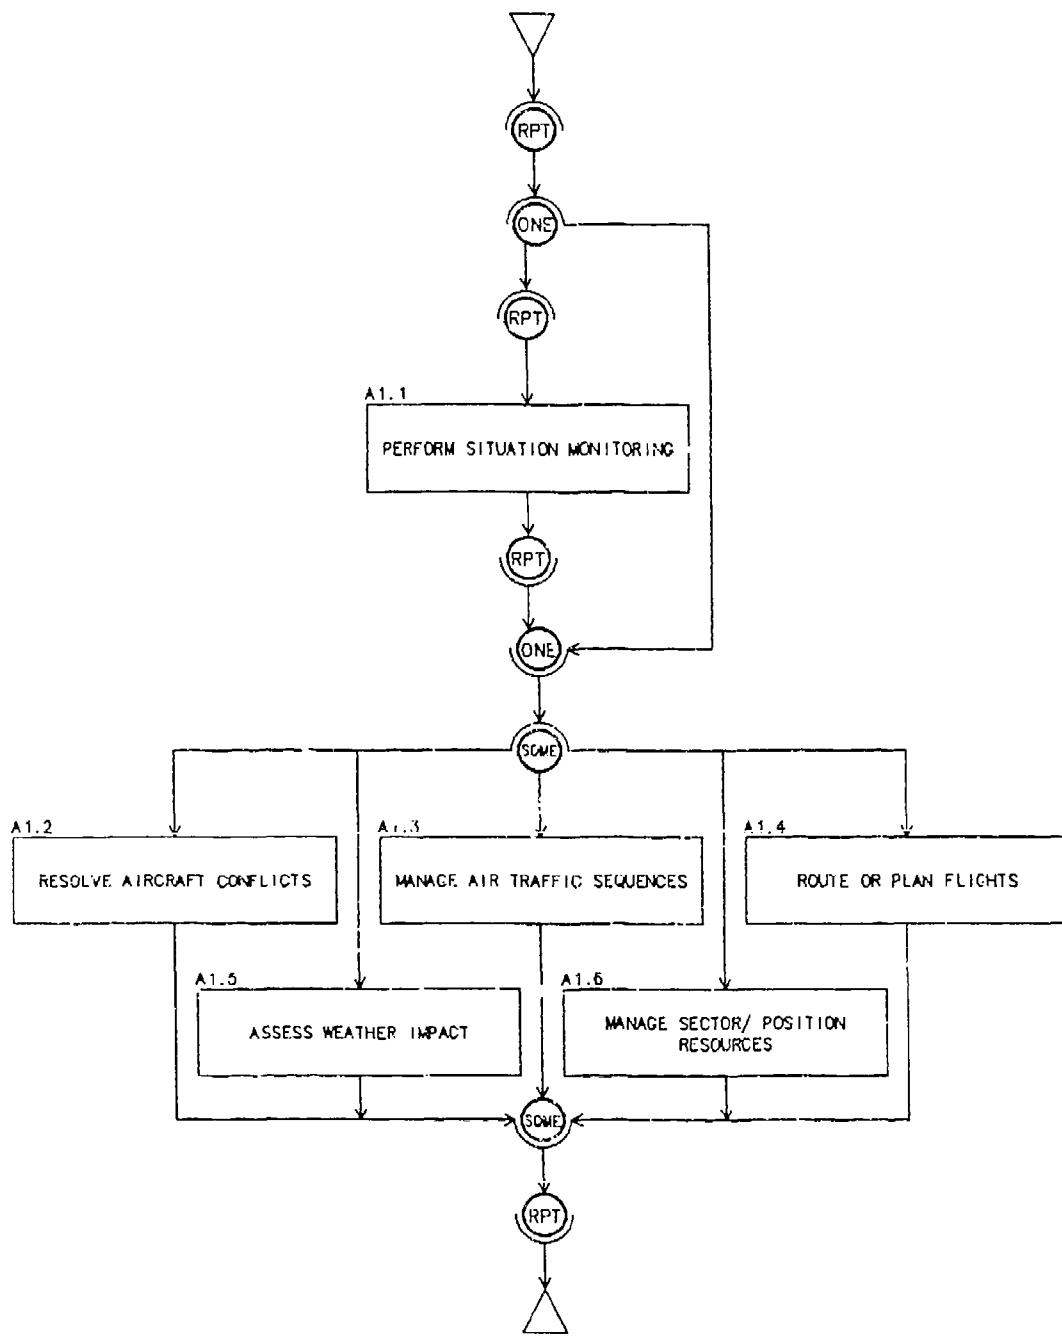

The graphing layouts of each of these macros appear following the top-level graph of position A1 activities, and preceding the full set of activity and sub-activity Composition Graphs.

APPENDIX B

TASK STATEMENTS AND EVENT TO SUB-ACTIVITY TRACE

This appendix is composed of two sections:

1. **Task Statements** - consisting of a list of the 371 ARTCC/ISSS en route controller tasks. The following summarizes the components of the Task Statements table:

Task Number - assigned number of each task statement.

Task Statement - concise statement of the task to be performed.

Coordination Media - coordination media may be one of three types: Voice (V), Function (F), and Message (M). Automated Coordination is reserved for AERA 2 and 3 use.

Coordinatees - designates the position/ agency contacted during coordination.

Transition State - indicates the AAS transition states for which the task is applicable - ISSS, TAAS, ACCC, AERA 1. AERA 2 and 3 reserved for future use.

Revision Date - indicates the date of last revision for each task.

2. ***Deleted***

3. **Event to Sub-Activity Trace** - noting the relation of ATC events (from Appendix A of Volume I) to each ARTCC/ISSS controller sub-activity graphed in Appendix A of this volume.

TASK STATEMENTS

Task Number	Task Statement	Coordination Media			Coordinates										Transition State	Revision Date			
		Voice Function	Message	Automated Coord.	ISSS/TMAS controller	Area Supervisor	Area Manager	Flight Service	Traffic Management	Mission Coordinator	Airway Facility/DSC	Meteorologist	Pilot	Tower Controller/Sup	Central Flow Control	Aeronautical Radio	Base Operations	Other Coordination	
A1	PERFORM ISSS DOMESTIC AIR TRAFFIC CONTROL																	X	06/30/87
A1.0.0.0	GENERATE CLEARANCE																	X X X X	07/05/88
A1.1	PERFORM SITUATION MONITORING																	X X X X	04/22/87
A1.1.1	CHECKING AND EVALUATING SEPARATION																	X X X X	04/22/87
A1.1.1.1	REVIEW FLIGHT DATA DISPLAY FOR PRESENT AND/ OR FUTURE AIRCRAFT SEPARATION																	X X X X	03/16/88
A1.1.1.2	REVIEW SITUATION DISPLAY FOR POTENTIAL VIOLATION OF AIRCRAFT SEPARATION STANDARDS																	X X X X	07/05/88
A1.1.1.3	REQUEST CONTINUOUS RANGE READOUT																	X X X	06/08/87
A1.1.1.4	PROJECT MENTALLY AN AIRCRAFT'S FUTURE POSITION/ ALTITUDE/ PATH																	X X X X	05/04/87
A1.1.1.5	REQUEST RANGE/ BEARING/ TIME MESSAGE, WITH OPTIONS																	X X X	06/08/87
A1.1.1.6	FORCE/ QUICK LOOK FULL DATA BLOCK(S) TO EXAMINE TRACK INFORMATION ON AIRCRAFT																	X X X X	03/16/88
A1.1.1.7	DETERMINE WHETHER AIRCRAFT MAY BE SEPARATED BY LESS THAN PRESCRIBED MINIMA																	X X X X	04/22/87
A1.1.1.8	SELECT FDE SORTING PRIORITY SCHEME																	X X X X	04/22/87
A1.1.1.9	OBSERVE TRACK VELOCITY/ DISTANCE VECTOR TO PROJECT AIRCRAFT MOVEMENT																	X X X X	04/22/87
A1.1.1.11	SUPPRESS CONTINUOUS RANGE READOUT																	X X X	06/08/87
A1.1.1.12	REVIEW SITUATION DISPLAY FOR POTENTIAL VIOLATION OF AIRSPACE SEPARATION STANDARDS																	X X X X	04/22/87
A1.1.1.13	REVIEW DISPLAYS FOR POTENTIAL VIOLATION OF FLOW RESTRICTIONS																	X X X	06/30/87
A1.1.1.14	REVIEW SITUATION DISPLAY FOR POTENTIAL VIOLATION OF CONFORMANCE CRITERIA																	X X X X	04/22/87

USER INTERFACE LANGUAGE

The User Interface Language (UIL) includes a data object hierarchy comprised of Logical Display Contents (i.e., User Display Language) and Input Messages (i.e., User Input Language). The Logical Display Contents refer to messages output to the en route controller at the Sector Suite workstation in the Initial Sector Suite System (ISSS) of the Advanced Automation System. These messages are output to the controller in the form of graphical displays, alphanumeric displays, and alerts/alarms or other signals for controller attention. The Input Messages refer to data and control messages entered by the controller to the system. This listing excludes messages not used by the ARTCC en route controller for Initial Sector Suite operations, and non-operational messages such as for training.

SECTOR SUITE LOGICAL DISPLAY CONTENTS

Table C-1 presents the Sector Suite Logical Display contents. Following are the notations employed in Table C-1:

=	Is defined as
or	= Exclusive "or"
and	= And
()	= Message items form a group
{ }	= Multiple iterations of a message item. Numbers added in the form X{ }Y indicate at least X but not more than Y iterations of the message. By default, X = 0 and Y = no upper limit defined.
[]	= Optional item (displayed or not displayed at controller's choice)
^ ^	= Mandatory message item if applicable
* *	= Comment
@	= Reference:
SLS	= Advanced Automation System, System Level Specification, 28 August 1987 [21] (Citations are by AP paragraph)
Task Analysis SSRVT	= Derived by task analysis and/or Sector Suite Requirements Validation Team
MD-314	= NAS Configuration Management Document, Local Outputs (NAS-MD-314, change level Q), 30 May 1986
FAA Academy TEM-17-1	= Weather for Air Traffic Control, Apr 87
CDRL B112	= FAA Air Traffic Control Operations Concepts (DOT/FAA/AP-87-01), Appendix C, 6 Nov 87

CONTROLLER INPUT MESSAGES

Table C-2 presents the messages input by the ISSS en route controller to the ISSS including operational messages (e.g., handoff, pointout, or status change) and system control messages (e.g., display adjustment). The following notations are used in this table:

=	Is defined as
or =	Exclusive "or"
and =	And
() =	Message items form a group
{ } =	Multiple iterations of a message item. Numbers added in the form X{ }Y indicate at least X but not more than Y iterations of the message. By default, X = 0 and Y = no upper limit defined.
[] =	Optional item
* * =	Comment

APPENDIX D

TASK CHARACTERIZATION ANALYSES

Included within this appendix are three separate task characterization analyses (reference Volume I, Section 3.4):

1. Task Information Requirements
2. Cognitive/Sensory Attributes
3. Performance Requirements
4. *Deleted*

TASK INFORMATION REQUIREMENTS

Task Information Requirements are developed by associating controller tasks with system communication messages, and occasionally by direct observation. Communications messages can be to or from another ARTCC sector controller, an ARTCC Area Supervisor, a computer display, or someone outside the ARTCC, such as an ATCT controller. The available system communication input and output messages for ARTCC/ISSS sector controllers are listed in Appendix C.

ISSS messages include controller-entered messages which may or may not update the ISSS data base, or computer output messages such as data blocks, flight data, weather, or status information. Messages between ARTCC positions or towers may be communicated by Voice Switching and Control System (VSCS), G.I. Message, or system function messages.

The following summarizes the components of the Task Information Requirements table (reference Section 3.4.1 of Volume I for more discussion):

Task Type: Tasks are categorized as belonging to one or more of four types:

- E (ENTRY) - Entry of data into ISSS by system message (e.g. function key) or by G.I. Message
- R (RECEIPT) - Receipt of information by means other than by voice communication; includes system messages, G.I. Message, and direct observation
- A (ANALYTICAL) - Cognitive assessment and evaluation of data, involving no input or output of information unless combined with another task type
- VC (VERBAL COMMUNICATION) - Transfer or exchange of information with another person via VSCS or directly.

Information Received (by the controller): Information can be received via Common Console display (including G.I. Message) or direct observation. Verbal coordination is not addressed. The topic of G.I. Message or object of direct observation is cited in non-UIL message terms.

Information Source: The source of information received can be a specific Sector Suite display, class of output message, G.I. Message or direct observation.

Information Entered (by the controller): Information is entered by the controller via console data input to the system. For information entered into G.I. Message, only the term "G.I. Message" is shown.

Frequency: Tasks are assessed relative to all other controller tasks as having HIGH (HI), MEDIUM (MED), or LOW (LOW) frequency of performance.

Criticality: Tasks are assessed relative to all other controller tasks as having EXTREME (EXT), HIGH (HI), MEDIUM (MED), or LOW (LOW) criticality.

System input messages, display output messages, and logical displays are stated in the terms provided in the User Interface Language of Appendix C. The context of a task's use in the Composition Graphs of Appendix A determines the extent of secondary task types associated with the primary nature of the task, as implied by the task action verb.

Controller activity and sub-activity statements are included in the table listing, as are the two macros, but their information requirements are not listed.

Of the 371 ARTCC/ISSS controller tasks, 167 tasks (45 percent) are rated as either Extreme or High criticality (26 Extreme and 141 High). Medium criticality is assigned to 130 tasks (38 percent). The remaining 74 tasks (20 percent) receive a Low criticality rating. Criticality ratings do not take into consideration the frequency of task performance. Thus, a number of the tasks involved with system malfunctions receive a High criticality rating because, when they would need to be performed, they would be critical to operations.

COGNITIVE/SENSORY ATTRIBUTES

This section provides a characterization of Extreme and High criticality tasks in terms of key cognitive and sensory human attributes involved in the performance of the tasks. These are the human abilities required to perform a task.

Fourteen cognitive and sensory attributes are relevant to the tasks inherent in Air Traffic Control. Definitions of each attribute and ATC examples of each attribute are provided in Section 3.4.2 (Table 3.4-1) of Volume I. The 14 attributes are grouped by type of task, as previously identified in the Task Information Requirements table of this appendix:

Associated With ENTRY (E) Tasks

Coding

Associated With RECEIPT (R) Tasks

- Movement Detection
- Spatial Scanning
- Filtering
- Image/Pattern Recognition
- Decoding

Associated With ANALYTICAL (A) Tasks

- Visualization
- Short-Term Memory
- Long-Term Memory
- Deductive Reasoning
- Inductive Reasoning
- Mathematical/Probabilistic Reasoning
- Prioritizing

Associated With VERBAL COORDINATION (VC) Tasks

Verbal Filtering

Analytical attributes predominate as key requirements of critical controller tasks, along with message filtering and decoding. The frequency of attribute association with the 167 critical tasks is as follows:

Coding	31 Tasks
Movement Detection	14 Tasks
Spatial Scanning	24 Tasks
Filtering	39 Tasks
Image/Pattern Recognition	21 Tasks
Decoding	61 Tasks

Visualization	42 Tasks
Short-Term Memory	33 Tasks
Long-Term Memory	9 Tasks
Deductive Reasoning	40 Tasks
Inductive Reasoning	28 Tasks
Mathematical/Probabilistic Reasoning	35 Tasks
Prioritizing	22 Tasks
Verbal Filtering	42 Tasks

PERFORMANCE REQUIREMENTS

The tasks identified in the Task Information Requirements as EXTREME and HIGH criticality require expeditious and accurate performance for effective control of aircraft. Particularly important performance characteristics for these tasks are identified in this section. An entry in the accompanying Task Performance Criteria table for a task indicates a performance criterion that is considered important to effective task accomplishment.

Different performance criteria apply to different task types. Refer to Section 3.4.3 (Table 3.4-2) of Volume I for the definitions and ATC examples of each performance criterion. The criteria that can apply to each task type are as follows:

Associated With ENTRY (E) Tasks

Accuracy of Entry
Implementation Time

Associated With RECEIPT (R) Tasks

Accuracy of Receipt
Recognition Time

Associated With ANALYTICAL (A) Tasks

Planning Time
Accuracy of Time Estimates
Accuracy of Spatial Estimates
Accuracy of Probability Estimates
Appropriateness of Action
Appropriateness of Timing

Associated With VERBAL COORDINATION (VC) Tasks

Implementation Time
Accuracy of Communication

Accuracy of verbal communications is the predominant performance criterion for these critical tasks. Accuracy of information entry and receipt via workstation displays, along with recognition time for system information, also are frequently associated with these tasks. For analytical tasks, the predominant performance criteria are the accuracies of estimates of spatial matters, situation probabilities, and of time. The frequency of performance criteria association with the 167 critical tasks is as follows:

Accuracy of Entry	28 Tasks
Implementation Time	4 Tasks
Accuracy of Receipt	43 Tasks
Recognition Time	36 Tasks

Planning Time	9 Tasks
Accuracy of Time Estimates	23 Tasks
Accuracy of Spatial Estimates	35 Tasks
Accuracy of Probability Estimates	32 Tasks
Appropriateness of Action	16 Tasks
Appropriateness of Timing	13 Tasks
Implementation Time	7 Tasks
Accuracy of Communication	79 Tasks

APPENDIX E

TASK ELEMENT STATEMENTS

The table presented in this appendix is actually a composite of sub-tables, each of which is devoted to the decomposition of a single controller task. Each sub-table contains an identifying Task Number (from Appendix B), Task Statement (from Appendix B), Task Type (from Appendix D), Coordination Media (Appendix B), Task Frequency and Criticality (from Appendix D) and four columns of information:

1. Element Number
2. Task Element Statement
3. Object(s)
4. Number of Objects

Element Number is an expansion of the Task Number to reflect a logical ordering or likely sequence of the element steps. The element number is unique, although the contents of a given element may be found in more than one task. Additional numbers, set off by decimals, are added to denote alternate modes of task accomplishment. O (for "Or"), A (for "And"), or A/O (for "And/Or") between elements indicates the end of a sequence of elements comprising such an alternate mode. This convention is needed in particular to denote where two entirely different processes may be employed, as in communication tasks which may be performed either via G.I. Message or by voice over the Voice Switching and Control System (VSCS).

Task Element Statement is presented in the structured form.

Verb – (modifier) – Object – (modifier) – (*descriptive information*)

Verb and Object portions are always present, the other portions being used as needed. Nomenclature for data objects follows the User Interface Language of Appendix C where possible. ISSS data objects are emphasized by underscores preceding and between words of the object name. An asterisk (*) preceding the Task Element verb indicates that the particular element may not always be performed.

Object(s) is a summation of the specific User Interface Language (Appendix C) data objects cited in the Task Element Statement.

Number of Objects projects how many instances or representations of each UIL data object a controller generally would deal with in performing the Task Element. Again, a generalized facility and time scenario is assumed. The numbers represent normal situations rather than worst-case scenarios or system limits.

APPENDIX E

The quantities of data objects assumed in certain specific situations frequently encountered in the Task Elements are as follows:

Full Data Blocks in the En Route sector (number of controlled aircraft)	27
Flight Data Entries in Flight Data Display	27
Sectors bounding sector airspace	5
Obstructions on Situation Display geographic map	3
Weather Descriptors on Situation Display	1

For data objects other than those listed here, no general assumption is made. Quantity of objects is assigned on a case-by-case basis to represent a "normal" situation.

NOTE: Due to the extensive revision of the data in this Appendix, black lines (side bars) in the margins to indicate substantive changes (see Foreword) from the original volume have not been used.

APPENDIX F

TRACEABILITY TABLES

Traceability of ACF/ACCC controller tasks to functional requirements of the System Level Specification [21] shows that functionality exists to support the task. Voice communication tasks and purely mental/analytical tasks will not trace to any SLS requirement; only tasks involving receipt or entry of Sector Suite information can be traced.

The task to SLS requirement traceability table in this appendix contains five columns of information:

Task Number

Task Statement

AAS SLS Paragraph Number

AAS SLS Requirement extracting the pertinent SLS text

Page Number of the requirement location in the SLS [21].

Following the presentation of all tasks, there is a list of "orphan" tasks. These are the tasks not containing any reference to an SLS paragraph. All of these orphan tasks should be of an Analytical or Verbal Communication task type (per Appendix D, Task Information Requirements), or a receipt task involving direct observation of an event or situation.

NOTE: Due to the extensive revision of the data in this Appendix, black lines (side bars) in the margins to indicate substantive changes (see Foreword) from the original volume have not been used.

APPENDIX G

SITE VISIT INFORMATION

No Air Traffic Control sites were visited as part of the preparation of this version of Volume III. Operations content was derived from the report of ACF/ACCC controller tasks in Volume II and from the current System Level Specification [21]. The task and element information was presented to the Sector Suite Requirements Validation Team (SSRVT) for review and validation.

APPENDIX H

EXPANDED OPERATIONAL SCENARIOS

This appendix contains expansions of the two baseline scenarios for ISSS terminal controllers (Appendix B of Volume I):

Scenario I: En Route High Altitude

Scenario III: En Route Low Altitude

Appendix B in Volume I of this series contains the background description of each scenario, the baseline scenarios from which the present expansion was produced, and the map of the fictitious airspace assumed for these scenarios. The explanation of these scenarios is presented in Section 3.2.6 of Volume I.

The scenarios are expanded by analysis of the baseline scenario data versus the Composition Graphs in Appendix A and the Task Information Requirements in Appendix D to show in detail how the controller might respond under each applicable scenario in the ARTCC/ISSS time frame. Thus, these expanded scenarios present a solution for each problem posed in the baseline scenarios.

Expanded scenarios in this appendix contain seven columns of data:

Time (in Zulu time reference) for each situation presented

Situation as introduced in the baseline scenario

Controller Task to identify the number and statement of tasks that are pertinent to that situation

Display Output Requirements to identify display output data objects that are pertinent to each scenario task

Source of the listed display outputs

Data Input Requirements to identify controller input data objects that are pertinent to each scenario task

Remarks to explain VS/CS actions and other useful information.

Above the last four columns is a line identifying the reference number for the scenario situation being presented. This number is to be used to track scenario situations between baseline and expanded scenario descriptions.

NOTE: Due to the extensive revision of the data in this Appendix, black lines (side bars) in the margins to indicate substantive changes (see Foreword) from the original volume have not been used.
